

1 **In the Specification**

2 Please replace the text appearing on page 8, line 14 through page 9, line 2
3 with the following:

4
5 --The framework 132 is a multi-tiered architecture that includes an
6 application program interface (API) layer 142, a common language
7 runtime (CLR) layer 144, and an operating system/services layer 146.
8 This layered architecture allows updates and modifications to various
9 layers without impacting other portions of the framework. A common
10 language specification (CLS) 140 allows designers of various languages to
11 write code that is able to access underlying library functionality. The
12 specification 140 functions as a contract between language designers and
13 library designers that can be used to promote language interoperability.
14 By adhering to the CLS, libraries written in one language can be directly
15 accessible to code modules written in other languages to achieve seamless
16 integration between code modules written in one language and code
17 modules written in another language. One exemplary detailed
18 implementation of a CLS is described in an ECMA standard created by
19 participants in ECMA TC39/TG3. The reader is directed to the ECMA
20 web site at the World Wide Web “.ecma” “.ch”.--
